maxon motors in security doors.

Security locks that are activated by small brushed DC motors.

Spanish manufacturer of security doors, RL safe doors, have patented door locking technology that is operated by maxon brushed DC motors and gearheads. The specialist locking system locks a door both on the inside and outside, without the use of a key. To re-open the door from the inside the simple motion of pressing down on the handle activates the motor to unlock the door. The brushed DC motor and gearhead combination for each of the security doors provides up to 5W of power. Specifically chosen for the low interference and ironless winding the maxon motors have been in these specialist applications since 2002.
