

DC motor drive systems at 30,000 feet.

The new look edition of maxon's driven magazine discusses the role DC motor and drive systems play in passenger aircraft.

The new look issue of maxon's driven magazine focuses on five exciting trends in the aerospace industry and poses the question, "what will travel look like in the future?". Air travel usage has increased immensely over the years. Prices are at a record low and planes are becoming even more efficient – in part due to electric drive systems, which are replacing outdated hydraulic systems. Several hundred drive systems are installed in every modern long-haul aircraft.

Also discussed are critical features of high-precision insulin pumps and a technical report on sensorless control of brushless DC motors.
